

Executive Brief

Project: Strategic Prioritisation of Supplier Quality Monitoring & Qualification

Context

Regulated industries experience recurring recall events with material risk exposure. Given limited executive bandwidth and capital allocation constraints, leadership must prioritise interventions based on structured, evidence-backed criteria rather than reactive response.

Evidence Summary

- 94%+ of recall events classified as Class I or II (moderate to severe impact).
- ~80% of recall events contain supplier/upstream indicators.
- 96% of supplier-linked recalls fall into Class I or II categories.

Decision Framework & Scoring

Criterion	Weight	Score
Risk Severity	30	5
Cost of Inaction	25	4
Detectability	20	4
Frequency	15	4
Feasibility	10	3

Final Weighted Prioritisation Score: 4.2 / 5

Sensitivity testing across multiple executive weighting scenarios (risk-heavy, feasibility-heavy, frequency-heavy) demonstrates stability within the 4.13 – 4.25 range, confirming robustness of the recommendation.

Strategic Recommendation

Supplier Quality Monitoring & Qualification should be prioritised as an upstream, high-leverage intervention. Strengthening supplier controls offers preventative impact by reducing exposure to high-severity regulatory events and downstream corrective costs.
